

WAFF India Edition – Proposed Action Plan and Collaboration Framework

I am Aditya Upadhyay, Founder of Quantum Leap AI and Media Production and Ambassador of WAFF in India. Quantum Leap AI and Media Production has been actively working in AI-driven filmmaking and media production for approximately two years. During this period, we have developed hands-on experience in creating complete feature-film experiences using AI as a core production language, including conceptualization, visual development, generation of production assets and frames, video creation, AI-native workflows, dubbing, music creation, and other elements required to bring a film from concept to completion. Alongside filmmaking, we have also worked with Indian Fortune 500 clients and other commercial clients on AI-driven advertising and media projects, helping them execute high-quality creative work while achieving significant efficiencies and cost savings. Our key strength is therefore not simply using AI tools, but understanding how to use those tools as part of a complete commercial filmmaking and production workflow.

This experience also gives us a strong position as a WAFF ambassador because the work that WAFF is trying to promote and create awareness around is something that we are already practically doing. While the industry has often questioned whether AI can be used for professional filmmaking and commercial production, our team has spent the last two years testing these tools in real workflows and using them to create actual commercial work. We have learned how to move from an idea and conceptualization stage into production, generate the required creative assets, build the film, and use AI across multiple stages of the process. We believe this practical experience can be valuable for WAFF because our role can go beyond simply representing the organization; we can also demonstrate, educate, create, and contribute to the actual filmmaking ecosystem that WAFF is building.

For the proposed WAFF India Edition planned for December 15, our immediate focus is on helping bring the necessary commercial support into the event. Since Quantum Leap AI and Media Production and my team are based in another city and are not originally from Mumbai, we are not currently positioning ourselves as the local venue or event-production team. Our primary focus is on our strongest areas: bringing sponsors and commercial opportunities, creating a feature film, contributing educational and professional content, and using our filmmaking experience to strengthen the overall value of the event. Our team has already started reaching out to potential sponsors and relevant organizations to bring funding and commercial partnerships into the India Edition. We will continue actively working on this and will communicate the progress directly with Marco and the WAFF team.

A very important principle for us is that any commitments, expectations, deliverables, benefits, or promises communicated to sponsors must ultimately become real and deliverable. We do not want to approach sponsors with expectations that cannot be fulfilled. Therefore, as we bring sponsors into the event, we would like the WAFF team to provide clear confirmation regarding what can actually be offered to each sponsor, what visibility and benefits they will receive, how

the event structure will work, and what deliverables WAFF will be able to provide. This is important because our credibility with sponsors is directly connected to the ability of the organization to deliver what is presented to them. Any sponsorship revenue and relevant commercial arrangements generated through our efforts will be transparently reported directly to Marco and the WAFF team. As previously discussed regarding Cannes sponsorships, our agreed commercial participation is 15% of sponsorship secured through our efforts, and the same 15% participation should also apply to sponsorships secured by us for the WAFF India Edition, subject to the final confirmation and documentation between both sides.

With regard to the event organizer and licensing structure, we believe there is an opportunity to approach a capable local organizer or commercial partner who could take responsibility for the event and potentially invest in the required licensing fee, which could be around USD 50,000 or another mutually agreed amount depending on the final structure. For this to happen successfully, the organizer must have a clear business case and understand how they will benefit financially and commercially from organizing the WAFF India Edition. Therefore, part of the planning should focus on creating a strong value proposition for the organizer, including sponsorship opportunities, audience and industry participation, branding, event visibility, licensing benefits, partnerships, and other commercial opportunities. Our team can focus on identifying and approaching such opportunities, while WAFF should provide the necessary structure, rights, deliverables, and commercial clarity so that potential organizers have a realistic reason to invest.

The second major area where we can contribute is filmmaking and education. Since WAFF is focused on promoting AI filmmaking and the positive possibilities of AI within the film industry, we believe the India Edition should include a strong practical demonstration of what is possible. We propose that, once the WAFF AI filmmaking tool is ready and accessible, Quantum Leap AI and Media Production should receive access or appropriate sponsorship/credits to use the tool to create a complete feature film. We would then present this film at the WAFF India Edition. This would create a powerful demonstration because the film would not only be presented as an AI-generated concept; it would be a complete production created by a WAFF ambassador/studio using the WAFF ecosystem or filmmaking tool. This would simultaneously demonstrate the capabilities of the tool, provide strong marketing for WAFF, demonstrate the practical capabilities of the ambassador network, and show creators in India and elsewhere that smaller studios and independent teams can use these technologies to create serious filmmaking projects.

We believe this concept can also become a repeatable model for future WAFF events. Instead of simply discussing AI filmmaking, WAFF could support its ambassadors or selected creative teams with access to its filmmaking technology, allowing them to create a film or substantial film project and present the result at future WAFF editions. This would turn the ambassador program into a practical demonstration network and would create continuous real-world examples of the technology being used to create films. For the India Edition specifically, our team is prepared to take responsibility for creating the feature-film project, provided we receive the necessary access, credits, support, and technical availability of the WAFF filmmaking tool.

Another major contribution we can make is through professional talks and knowledge-sharing sessions. We can give a practical session on AI filmmaking, based on our own two years of

experience, explaining how a team can use AI from conceptualization through production and post-production, how to structure an AI-native workflow, how different tools can be integrated into a commercial pipeline, how AI can be used for video, dubbing, music, visual development and other production requirements, and what we have learned through actually delivering commercial projects. We would be happy to contribute this session to the WAFF India Edition, and the same type of professional discussion could later be adapted for other WAFF events, including Cannes. However, for the moment, our immediate priority is to structure the India Edition properly and make it successful.

There is also an opportunity for Quantum Leap AI and Media Production to support WAFF in the creation of documentary or other film content that WAFF may be developing. As discussed with Marco, if the WAFF team requires additional filmmaking support and is finding it difficult to assemble sufficient production capacity, our team can potentially contribute to the creation of such a documentary or related project. Since this would be an actual production engagement, the commercial terms, scope, timeline, deliverables, production requirements, and pricing would need to be discussed separately on a project-by-project basis. We are open to exploring this collaboration and having a detailed discussion once the exact project requirements are clear.

Our overall action plan is therefore built around three primary contributions from our side: first, actively working to bring sponsors and commercial partners into the WAFF India Edition; second, contributing our practical experience through a professional AI filmmaking session and knowledge-sharing presentation; and third, creating a complete feature film using the WAFF filmmaking tool and presenting that film at the India Edition as a practical demonstration and marketing opportunity for both WAFF and the technology. In addition, where required and where commercially appropriate, we can support WAFF with documentary and other film-production requirements.

For this collaboration to move forward effectively, we mainly require support and clarity from the WAFF side. Most importantly, we need a clear understanding of the final event structure, sponsor deliverables, organizer/licensing framework, and the commitments that can be confidently presented to external partners. We also require access to the WAFF AI filmmaking tool, including the necessary credits, permissions, or technical support required for us to produce the proposed feature film. We would also appreciate clarity on the intended format of the professional talk, the role of ambassadors at the India Edition, and the broader expectations from our team so that we can align our efforts accordingly.

Our intention is to build a collaboration where both sides bring their strongest capabilities. WAFF brings the international platform, brand, network, festival ecosystem, and technology initiative, while Quantum Leap AI and Media Production brings practical AI filmmaking experience, commercial production expertise, an active production team, sponsor outreach, and the ability to actually create and demonstrate AI films. We believe this combination can make the India Edition substantially stronger and can also establish a practical model that WAFF can replicate in future editions and markets.

At this stage, our team has already started working on sponsor outreach and commercial opportunities, while our core focus remains on what we do best: creating AI films, building AI-

native production workflows, educating audiences through practical sessions, and demonstrating what is commercially possible with AI filmmaking. We would therefore like to move forward with a clear division of responsibilities, transparent commercial terms, confirmed sponsor deliverables, access to the WAFF filmmaking tool, and a realistic production framework for the India Edition. With these elements in place, we believe we can contribute significant value to WAFF and create an India Edition that is not only an event, but also a practical demonstration of the future of AI filmmaking.
